JUNE  
THURSDAY

# Kubernetes

①

- 8     ① It is open-source container engine or container management tool
- 9     ② It automate deploy, scaling, & managing container app

10

② Kubernetes → K8S

③ google → CNCF handing Kubrate

Cloud Native Computing Foundation

~~IMP~~

- 1     ① It is hard to handle multiple containers at a time so that why it comes into picture & It automate process also to manage container app.

4 Deploy, scaling, scheduling, Load Balancing  
 monitoring, Roll Back, Batch Execution

5 Components

POD

NODE

cluster

Replication set / controller  
Service

Deployment

Secrets

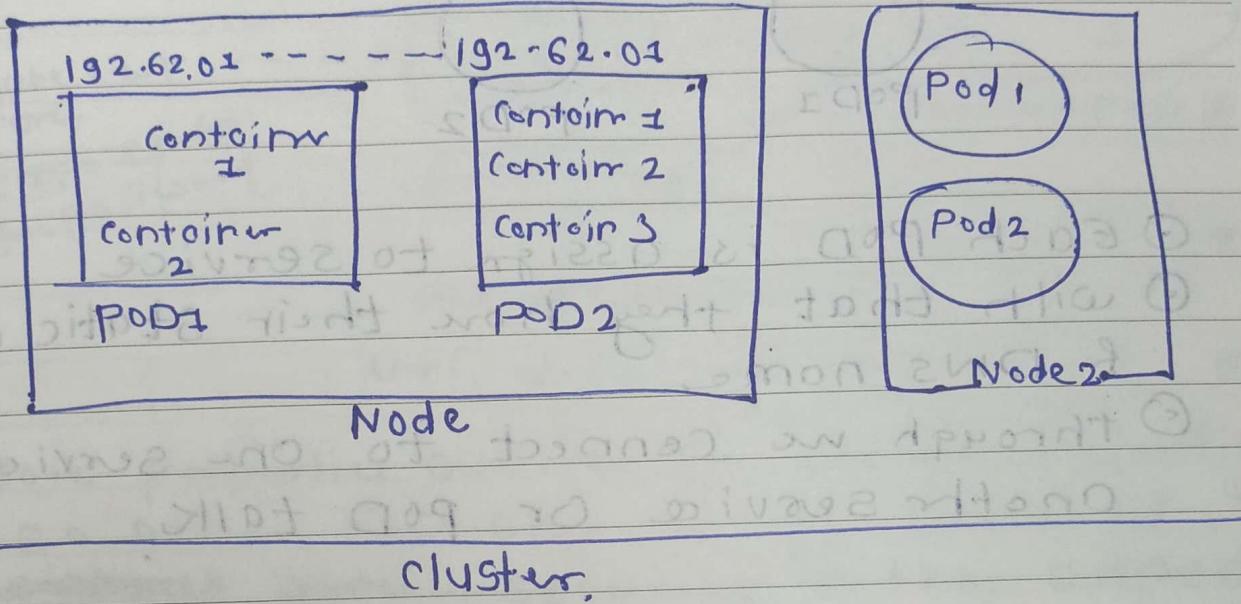

Config Map

ETCD

| T  | W  | T  | F  | S  | JUL    |
|----|----|----|----|----|--------|
| 4  | 5  | 6  | 7  | 8  | 1 2023 |
| 11 | 12 | 13 | 14 | 15 |        |
| 18 | 19 | 20 | 21 | 22 |        |
| 25 | 26 | 27 | 28 | 29 |        |

JUNE  
FRIDAY

16

POD → ① हमें एक container <sup>जो</sup> multiple container तक संबंधित है।

② Every POD has unique IP address.

③ multiple POD connect with each other with that unique address.

Node → ① Node contain one or more POD

cluster. ① cluster contain one or more Node inside cluster.

Replicaset → ① Each POD have unique address

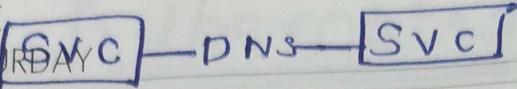

② Due to some issue POD goes crash or (self healing)

③ at that time we have Backup POD

∴ For POD1 → I have 3 Backup POD, with different address.

④ so it will replace that existing POD & assign new IP of that specific POD

17

JUNE  
SATURDAY

|      | M  | T  | W  | T  | F  | S  | S  |
|------|----|----|----|----|----|----|----|
| 2023 | 1  | 2  | 3  | 4  | 5  | 6  | 7  |
|      | 8  | 9  | 10 | 11 | 12 | 13 | 14 |
|      | 15 | 16 | 17 | 18 | 19 | 20 | 21 |
|      | 22 | 23 | 24 | 25 | 26 | 27 | 28 |
|      | 29 | 30 | 31 |    |    |    |    |

Service

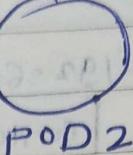

100.1.2.

8

9

100.1.2.3

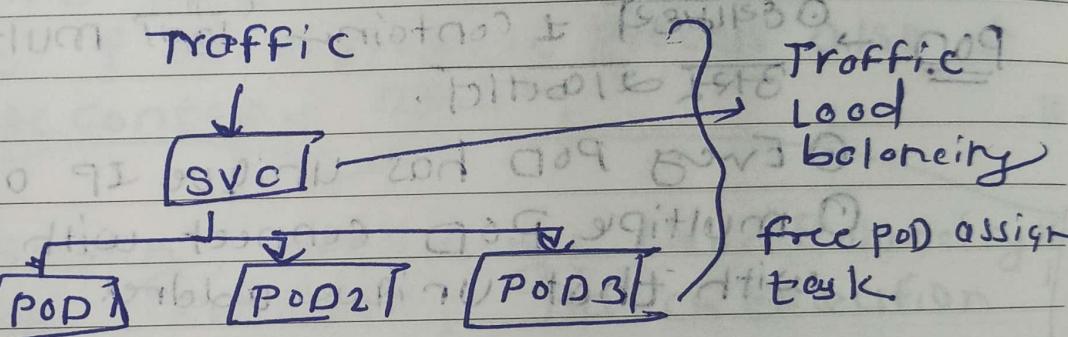

- 10 ⓠ Each Pod is assigned to service
- 10 ⓡ with that they have their static address
- 11 - ↳ DNS name
- 11 ⓢ through we connect to one service to another service or pod talk.

1

Traffic

2

3

Service Type - ① cluster IP

4

② Node &amp; Port

③ Load Balancer

5

6

Deployment → ① It is used to manage pods,  
 ② we can scale app by increasing no. of pod or update running app using Deployment object

Kubectl create deployment first-deployment -

image = &lt; Docker Img Name &gt; - port = 8080 --replicas = 1

|    |    |    |    |    |    |    |

Present outside Pod

WK 24 • 169-196

JUNE  
SUNDAY

18

### Secrets & configmap

- Store properties outside in secret & configmap so other POD also easily access it.
- ~~With access~~ security extra added.

### \* ETCD

- Kubernetes ETCD uses to store config of Kubernetes cluster
- It is key-value database store
- It stores all secrets & configmap data inside ETCD database
- max limit is 1mb to store secrets

Kubernetes → minimum cluster → at least one master & workers

170-195 • WK 25

## Kubernetes Arch

8

[cluster]

9

[master Node]

11

Pod

12

Pod

WorkerNode

WorkerNode

① Master Node will monitor WorkerNode running smoothly or not

② Master Node will check Pod working or not

③ If any Pod goes down New Pod will assign with New IP

④ If any Nodes are down then it will tag all pods to New Node

\* master Node

→ API server

② Scheduler

③ Controller Manager

④ ETCD

components

① API Server → ① Cluster gateway,  
② K8S UI

③ Command Line Tool  
(Kubectl)

2023 ➤ Health of Pod = Kubectl get nodes  
Kubectl get pods

JUNE  
TUESDAY

20

① schedular → It take decision on which Node new POD will add.

Based on CPU memory,

Current POD use, memory

② ETCD → Key-value pair database

③ controller manager → manage controller.

Node → i) Node controller

Health → ii) Replication controller

Service → iii) Endpoint controller

### WORKER NODE

① Kubelet → communicate with master node using API server.  
 work (some)

② Kube-proxy → It runs on each node.  
 ∵ It is responsible for maintaining Network config rules.

iii) Container runtime → help to run container inside pods.

\* Minikube → ① run k8s cluster in Local machine  
 ② It runs single-node Kubernetes cluster on Local machine

\* Kubectl → command line tool to communicate with Kubernetes.  
checkbox install for windows.

Both Install.

Start KubeMate Dashboard  
command → minikube dashboard

JUNE  
SATURDAY

24

## 1 ingress.yaml

apiVersion: networking.k8s.io/v1

kind: Ingress

meta data:

name: food-catering-ingress

spec:

rules:

- host: debapp.com → Ingress host name

get http://20.10.10.10:8080

Paths:

- path: /service1 → दृ पथ मानी जाती है

Path Type: prefix

backend:

Service:

name: Service1

Port:

Numbr: 80 → default port

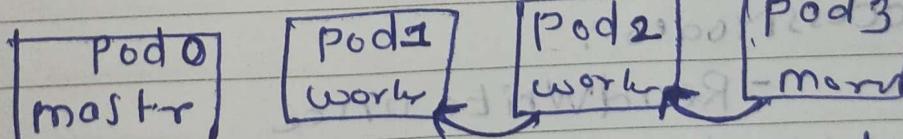

HTTP Service

redirect

HTTP

## ★ Kubernetes Statefulsets

### MySQL

Based on previous create

1001

Pod3

work

mem

(delete 3 then 2 soon)

- ① It scale based on previous pod
- ② If it delete last pod then 2nd last like that

2023

25

|      | 29 | 30 | 31 |    |    |

★ Kubernetes Volumes

8

① outside cluster store data into volume

9

1. storage should not depend on Pod Lifecycle  
Colwog Available not based on old pod

10

2. storage should be ~~all nodes~~ available for

11

3. storage should survive cluster crashes

12

PersistentVolume.yaml [claim] also

1

apiVersion: v1

2

kind: PersistentVolume

metadata:

3

name: Volume-Backup

labels:

4

type: local

5

spec:

storageClass: None: manual

capacity:

storage: 10G

accessModes:

- ReadWriteOnce

6

hostPath: no forced 31052 + 0

7

path: "/mnt/data"
